

Intro to Computer Systems :: Project 8: VM Translator II

Student name: _____

Grading method

In evaluating the second part of your VM Implementation program (AKA Translator) we look into the following things:

- **Code quality:** since the software design was provided, your code will be judged mainly for elegance and readability.
- **Correctness:** your translator must translate correctly the supplied VM test programs: FibonacciElement and StaticTest (we call this "dry test"). In addition, it must translate correctly some other programs that were not supplied (we call this "wet test"). "Correct translation" occurs when the Translator generates Hack code that, when run on the CPU Emulator, generates the desired results.

Category	Points	Comments
Packaging	/ 5	Directory (folder) with your name on it, containing (1) /src directory of your code, (2) a README file with instructions for compiling and running your program, and comments on things that don't work and how you tried to fix them.
Code quality:	/ 30	
Dry test:	/ 40	
Wet test:	/ 25	

Total grade: _____
